

Problem

Problem Statement

You are given a grid of dimensions $N \times M$. Each cell contains one of the following values:

0 → Empty cell 1 → Fresh orange 2 → Rotten orange

A rotten orange can rot an adjacent fresh orange in 1 unit of time.

A rotten orange at position (i, j) can rot fresh oranges at:

$(i-1, j)$ → Up $(i+1, j)$ → Down $(i, j-1)$ → Left $(i, j+1)$ → Right

Find the minimum time required to rot all fresh oranges.

If it is impossible to rot all fresh oranges, print -1.

If there are no fresh oranges initially, the required time is 0.

Input Format

The first line contains an integer T , the number of test cases. For each test case: The first line contains two integers N and M , representing the number of rows and columns. The next N lines contain M space-separated integers representing the grid.

Constraints

$1 \leq T \leq 100$ $1 \leq N, M \leq 500$ $grid[i][j] \in \{0, 1, 2\}$

Output Format

Print a single integer representing the minimum time

```

42         xCoords[tail]=xNext
43         yCoords[tail]=yNext
44         tail++;
45     }
46     }
47     size--;
48 }
49 time++;
50 }
51 if(fresh>0) {
52     System.out.println(-1);
53 }else {
54     System.out.println(time);
55 }
56 }
57 }
58 }
```
